£120.95 4.4★

If you want a direct radon alternative, the closest upgrade is the Airthings Corentium Home 2. It stays in the same trusted Airthings family but adds Bluetooth, temperature and humidity readings, plus a longer battery life. Compared with the original Corentium Home, it's more feature-rich and easier to check on your phone, but it costs more and still only focuses on radon and basic comfort metrics. Choose this if you want a better long-term radon monitor for a UK home where basement rooms, ground-floor bedrooms, or properties with known radon risk are a concern.

The Airthings Wave Plus is a broader indoor air quality monitor, not a pure radon detector. It measures radon, CO2, VOCs, humidity, temperature, and air pressure, so it's better if you also want to understand stale air, mould risk, and ventilation problems — especially useful during damp UK winters. What's better is the extra insight; what's worse is the higher price and the fact that it's less focused if radon is your only priority. Pick this if you want one device to track the full picture, not just radon.

SAF Aranet4 Home is one of the best alternatives if your main concern is CO2 and ventilation rather than radon. It's portable, battery-powered, and has a clear e-ink display, making it easy to move between rooms or use in a bedroom, office, or nursery. It beats the Corentium on live CO2 visibility and day-to-day usability, but it does not detect radon. This is a better choice if you're more worried about stuffy air, poor sleep, or mould-prone humidity than radon specifically.

The SwitchBot CO2 Detector is the budget-friendly pick here. At a much lower price than the Airthings Corentium Home, it gives you CO2, temperature, and humidity monitoring with data storage and app support. It's better value if you want to keep an eye on ventilation in smaller UK rooms without spending over £100. The downside is that it's not a radon detector, and WiFi features require

a SwitchBot Hub. Choose it if affordability matters most and you mainly want a simple indoor air monitor.

Amazon Smart Air Quality Monitor is the easiest mainstream option for Alexa users. It tracks air quality basics and integrates neatly into a smart home setup, which makes it convenient for households already using Amazon devices. It's cheaper than the Corentium and more versatile for general air monitoring, but it won't replace a proper radon detector and it offers less specialist reassurance. This suits buyers who want a simple, connected monitor for everyday air quality rather than a dedicated radon solution.

In short: if you need radon detection, stay with Airthings. If you want broader indoor air insights, better app features, or a lower price, one of the alternatives above may be a smarter fit.

Still Buy the Original If...

Buy the original Airthings Corentium Home if your main goal is a simple, portable, battery-powered radon detector with a strong reputation. It's still the most straightforward choice for homeowners who want reliable radon monitoring without extra app complexity.
